Time: 6/2/2024 – 20/2/2024

We have met with John McNamara on the 6th February and showed our progress to him. John suggested ways to improve the script and audio generation.

Script:

Finished the script generation and the RAG feature. It now generates good quality scripts with the names of narrators indicated as well as structure elements (intro, outro etc).

Audio:

It now adds music on the background based on the theme/mood of the script. It returns an mp3 file with the speech and music combined.

Web:

We've implemented the backend server code and the connection between frontend, backend and database. Currently the frontend only reads data from the database, but we plan to implement more features later.

The plan for the next week is to:

- Integrate RAG with the rest of the script.
- Start video generation (static image used for video).
- Continue with the website building.
